Remote control drone price in nepal

I need a remote control of two 12 volt motors each need to operate independently of the other and both motors should be forward and back if you have any tips or diagrams on how to control this remotely please leave a comment. Gadget NowSlideShowsDrone controlGadgets Now Bureau19 Mar, 2016, 02:30PM ISTFacebookTwitterLinkedIn112Drones is a hot property and despite the ambiguity around its use in many parts of the world, the numbers are only increasing. VR provides a way to control drones even when you can't see them. It is now possible to send a drone on a reconnaissance mission - it will send a live feed from its camera to your VR headset so you can control it remotely. Companies like FLYBI, Ghost Drone, and CloudLightFPV have consumer-ready products in this space.21211 Incredible use of virtual realityYou may have seen the videos' tilt & on Facebook or a different version of the virtual reality headset. VR is becoming popular and after the initial excitement of 360 videos and photos is gone, you'll realize that there are more apps.312MoviesWhen you're wearing a VR headset, it blocks all the ambient light and distractions so your experience doesn't disintegrate. This makes VR a great option for watching videos and movies - it can really make you feel as if you're sitting in a movie theater, complete with seats and screens. Netflix already has a VR app, compatible with Samsung's Gear VR headset. It shows content in HD resolution of 720p.412GamingThis is one of the areas where VR has been used since the 1990s. However, 2016 is pegged as the year when VR games may actually take off. There are so many games already available for different VR platforms. A number of developers including Valve and Sony have announced support for VR and are set to announce special games. Improvements in smartphone display and processing have also paved the way for smartphone-connected VR headsets for gaming.512Virtual tourismSince VR shows a 360-degree view, using it for virtual tourism is brainless. VR demos of monuments, museums, and popular tourist destinations are likely to number in the thousands. You can get started with Google Cardboard (or similar headsets) and your most basic smartphones. Just search for VR in the app store and you'll find what you need. Will it affect real tourism? Maybe - but at least it's much more affordable than actually traveling the world.612Crime scene reconstructionVR has the ability to put you in different places and times. It's perfect for crime scenes as it can help find and analyze something that was missed earlier. The scenes can be graphed at 360 with advanced cameras and a series of events can be reconstructed at a later stage. Investigators will be able to wear a set of VR goggles and look around to find more clues. This is even more important when the integrity of the crime scene will not last like on a busy road or next to someone's house.712 Car showroomVirtualMany carVirtualMany fans want to visit different car showrooms - take the atmosphere, sit inside, start the engine and so on. Apps like Relay Cars are already available and you can do just that. Step inside, look around, see videos of cars and even start the engine to hear what it sounds like. The noises are sampled from the actual car so what you hear is what you get. Once adopted by mainstream manufacturers, you will be able to visit a group of showrooms without leaving your home.812See your own contentSince many VR headsets use your smartphone as a screen, you can use it to access local content. For example, the free VR Cinema app automatically splits videos stored on your phone into side-by-side views so they can be viewed in a VR headset. Similarly, you can play 3D movies from your device on a VR headset. An app called Scene lets you capture 3D images with your phone that can later be viewed in streaming VR.912Live eventsWe always remember the OnePlus VR live streaming from the OnePlus 2 smartphone. All you have to do is install the app and you can instantly see the launch event in 360 degrees using Google Cardboard or a similar headset. Samsung also offered a taste of VR at the launch of the Samsung Galaxy S7 and S7 Edge in Barcelona a few weeks ago. Going forward, this looks like a trend in the making. Spectators from across the board can see the event while sitting at home.1012 Similar healthcareCT scans can determine anomalies with high accuracy. The problem is, doctors should look at these scans on flat screens and prints. With VR, doctors can view scans with much larger details and manipulate them in a 3D space. This means a faster and better diagnosis. Other applications in medicine include remote surgical equipment, risk-free training from health care professionals and in some cases, even patient care.1112 The dimensions of beds to home shopping areas quickly move to a delivery model only. From clothing & shoes to groceries, everything moves to the app. The next logical step is VR shopping. Major retail chains are already experimenting with virtual shopping where you can 'walk' into stores, search and check out the products you want and add them to your cart. They'll be taken home without you leaving the couch. It could also advance to a mall that will have several stores under the same virtual roof.1212 Military trainingWhat makes the perfect soldier? It's training - as much as possible. VR can complement actual training, placing soldiers in a safe environment while simulating all possible situations and enemies. This is currently being done with flight simulations and Battlefield. Advanced moving VR rigs can also place soldiers on moving platforms for better simulation. Rights © 2020 Bennett, Coleman & Co. Ltd. All rights reserved By The Times of India. For reprint rights: Times Syndication Service April 26, 2018, 12:00 PM UTC / Source: TODAYBy Jeff Rossen and Lindsey BominSeveral big big including Amazon and Google, vying to make drone deliveries a reality. But one company is already doing it, creating what they call the world's fastest drone. And it doesn't need to be remotely controlled: everything is already programmed with GPS. Get Jeff Rossen's new book, Rossen to the Rescue, here. The company, Zipline International, already uses drones to deliver medical supplies in Africa. Their next target: The U.S. This new delivery drone flies 80 mph and doesn't need remote controlApril 26, 201804:12In an area surrounded by farmland about 45 minutes outside sacramento, California, today national investigative correspondent Jeff Rossen gets an exclusive look at the new drone in action. When you place a delivery, we can program the coordinates into the plane, launch it, explained Zipline CEO Keller Rinaudo. The plane flies autonomously wherever it needs to make deliveries, and then takes itself home. Rinaudo said the drone travels 80 mph and can deliver more than 100 miles away. Each distribution center can make more than 500 deliveries a day and serve 10 million people, he added. To demonstrate the technology, Rossen and Rinaudo drove into the drop zone while flight engineers loaded the drone with a package and launched it into the sky. Once the drone is in the air, going from 0 to 60 mph in half a second, engineers can track its flight path in real time due to zero in the exact GPS coordinates and drop the package, which lands with a parachute just in front of Rossen and Rinaudo. This is the future of shipping, Rinaudo said. This will happen for health care logistics by the end of the year. For ordinary items, he said they hope to make that happen in the next few years. Rossen also got an exclusive demonstration of how drones land... without a runway. Watch this new ground delivery drone - no runway! April 24, 201800:32To suggest topics for future investigations, visit the Rossen Reports Facebook page. Our editors independently research, test and recommend the best products. You can learn more about our review process here. We may receive a commission on purchases made from our preferred link. Going to the skies with our collection of the best remote control helicopters, our collection of professional RC rotor wing aircraft and hobbies is here to help you fulfill all your deepest Apocalypse Now fantasies. Besides how cool they look, there are a few things to consider before buying an RC helicopter. This toy does have something of a learning curve, so if you're new to hobbies, we'll recommend one that's suitable for beginners. But if you're a vet spice up with some flight time under the belt you, there are some amazing options that will allow you to perform some fancy maneuvers. For the best combination of flight control, battery life, and quality, take a look at the E-flite Blade mCX2 RTF RC Helicopter. Already assembled right out of the box, this ready-to-fly model allows you to and walk in a few minutes. Perfect for first-time operators and professionals, the mCX2 includes two flying modes: one is RTF (short for ready to fly) and the other is the Blind & Fly that lets you speed things up if you feel rt a little too slow). Coaxial design eliminates stability concerns while in flight and counter rotating blades help maintain flight control with minimal user intervention. The 3.7V 120mAh lithium battery pack allows flight times up to eight minutes and recharging takes about 90 minutes. With a more powerful motor, higher capacity battery, excellent control and best-in-class stability, the mCX2 is a smart choice across the board. This palm-sized helicopter is only eight inches long, but what the SIMA S111G lacks is more than just making it at wallet-friendly prices. Ready to get out of the box with five to six minutes of flight time, it only takes 30 minutes of charging to get the S111G back into the air, allowing dozens of opportunities to fly every day. The Coast Guard design adds a bit of extra design flair to durable frames that are more than capable of standing up to novice users who may find themselves on the wrong end of an accident. Utilizing an integrated electric gyroscope system, the S111G is easy to control and allows extra stability during flight. Adjustable trim controls and multi-directional flight controls allow the helicopter to move up and down and rotate clockwise and counterclockwise, as well as moving forward and backward. Coaxial blades provide extra stability and durability during flight. Easily one of the most popular remote control helicopter models available today, the eight-inch Syma S107G offers beginner-friendly functionality without breaking the bank. The three-channel control allows the initial user to learn the basics of steering (top and bottom, forward or backward, as well as left and right). The included remote control adds an alignment trim button to quickly flatten the helicopter if it escapes you while on the flight. The 150mAh battery means 12 minutes of flight time on a 30-minute charge, giving it an extra few minutes in the air during the competition at the same price. Add a lightweight design that tends not to break or crash and this special option in the room becomes more attractive to first-time operators. Our top Weapon Final Verdict for remote control helicopters should be the MCX2 E-Flite Blade, striking a remarkable balance between quality and ease of use. It brings together some solid features without breaking the bank. However, if you are just starting this hobby or happen to be stuck indoors, the GPToys G610 is more compact but still a lot to fly, it will not damage your TV if you lose control. Design - Sure, you want a 'copter that looks cool, but design refers to more than aesthetics. Most novice helicopters have a coaxial design that ensures and a durable body that helps him survive the inevitable accidents. A more sophisticated design, by contrast, will allow you to do flips, loops and reels. Reach - The sky is your playground, as long as you are within reach, that is. The flight range on a standard remote control helicopter hovers around 50 feet, although high-end design (read: more expensive) can get you further. Battery - It's all fun and games until your battery dies and your helicopter comes crashing to the ground. Most remote control helicopters on the market will give you between five and ten minutes of air time, depending on how you fly it. It is also wise to check how long it will take to charge the battery as some take as much as 30 minutes, while others will keep you waiting up to 90. Pro tip: Bring a backup battery if possible. Maybe.
